HW3.0.

What is a merge sort? Where is it used in Hadoop? How is a combiner function in the context of Hadoop? Give an example where it can be used and justify why it should be used in the context of this problem. What is the Hadoop shuffle?

Solution

Merge sort is an algorithm that belongs to family of Merge algorithms that takes an approach of divide and conquer by splitting up a list of n unsorted elements into n sublists with 1 element each and further repeatedly merges sublists while sorting them until only 1 sorted sublist remains.

Conceptually, a merge sort works as follows:

```
1. Divide the unsorted list into n sublists, each containing 1 element
(a list of 1 element is considered sorted).
2. Repeatedly merge sublists to produce new sorted sublists until there
is only 1 sublist remaining. This will be the sorted list.
```

merge sort has a time complexity of $O(n \log n)$

Merge sort in Hadoop could be used in situation where individual sorted lists need to be merged and sorted. This is used in hadoop to merge partition files stream to reducer.

merge sort of sorted lists has a time complexity of $O(n)$

Combiners are an optimization in MapReduce that allows for aggregation before the shuffe phase. In a word count problem in MapReduce combiners and be used for aggregation to reduce the number of tuples transferred across the network from mappers to reducers.

```
Input:
 It is a sunny day
 It is a rainy day

Mapper output :
 [ (It,1) (is,1) (a,1) (sunny,1) (day,1) (It,1) (is,1) (a,1) (rainy,1)
(day,1) ]

Combiner Output:
 [ (It,2) (is,2) (a,2) (sunny,1) (day,2) (rainy,1) ]
```

Hadoop shuffle refers to processes that happen between the mapper producing the output and the reducer consuming it. When the map function starts producing output it's not simply written to disk. The shuffle patitions, sorts, and combines mapper outputs before sending them to the reducers, taking advantage of buffering write in memory and doing some presorting for efficiency reasons. In the end, the reducer receives a merged partition file sorted by key.

HW3.1

Use Counters to do EDA (exploratory data analysis and to monitor progress) Counters are lightweight objects in Hadoop that allow you to keep track of system progress in both the map and reduce stages of processing. By default, Hadoop defines a number of standard counters in "groups"; these show up in the jobtracker webapp, giving you information such as "Map input records", "Map output records", etc.

While processing information/data using MapReduce job, it is a challenge to monitor the progress of parallel threads running across nodes of distributed clusters. Moreover, it is also complicated to distinguish between the data that has been processed and the data which is yet to be processed. The MapReduce Framework offers a provision of user-defined Counters, which can be effectively utilized to monitor the progress of data across nodes of distributed clusters.

Use the Consumer Complaints Dataset provide here to complete this question:

`https://www.dropbox.com/s/vbalm3yva2rr86m/Consumer_Complaints.csv?dl=0`

The consumer complaints dataset consists of diverse consumer complaints, which have been reported across the United States regarding various types of loans. The dataset consists of records of the form:

Complaint ID,Product,Sub-product,Issue,Sub-issue,State,ZIP code,Submitted via,Date received,Date sent to company,Company,Company response,Timely response?,Consumer disputed?

Here's is the first few lines of the of the Consumer Complaints Dataset:

Complaint ID,Product,Sub-product,Issue,Sub-issue,State,ZIP code,Submitted via,Date received,Date sent to company,Company,Company response,Timely response?,Consumer disputed?
1114245,Debt collection,Medical,Disclosure verification of debt,Not given enough info to verify debt,FL,32219,Web,11/13/2014,11/13/2014,"Choice Recovery, Inc.",Closed with explanation,Yes,
1114488,Debt collection,Medical,Disclosure verification of debt,Right to dispute notice not received,TX,75006,Web,11/13/2014,11/13/2014,"Expert Global Solutions, Inc.",In progress,Yes,
1114255,Bank account or service,Checking account,Deposits and withdrawals,,NY,11102,Web,11/13/2014,11/13/2014,"FNIS (Fidelity National Information Services, Inc.)",In progress,Yes,
1115106,Debt collection,"Other (phone, health club, etc.)",Communication tactics,Frequent or repeated calls,GA,31721,Web,11/13/2014,11/13/2014,"Expert Global Solutions, Inc.",In progress,Yes,

User-defined Counters

Now, let's use Hadoop Counters to identify the number of complaints pertaining to debt collection, mortgage and other categories (all other categories get lumped into this one) in the consumer complaints dataset. Basically produce the distribution of the Product column in this dataset using counters (limited to 3 counters here).

Hadoop offers Job Tracker, an UI tool to determine the status and statistics of all jobs. Using the job tracker UI, developers can view the Counters that have been created. Screenshot your job tracker UI as your job completes and include it here. Make sure that your user defined counters are visible.

HW 3.2 Analyze the performance of your Mappers, Combiners and Reducers using Counters

3.2 Part 1

For this brief study the Input file will be one record (the next line only): foo foo quux labs foo bar quux

Perform a word count analysis of this single record dataset using a Mapper and Reducer based WordCount (i.e., no combiners are used here) using user defined Counters to count up how many time the mapper and reducer are called. What is the value of your user defined Mapper Counter, and Reducer Counter after completing this word count job. The answer should be 1 and 4 respectively. Please explain.

In [4]:

3.2 Part 1 Response

1. Invoke the hadoop job specifying the number of Map tasks and reduce tasks by using the following options
   - -D mapred.map.tasks=1 \
   - -D mapred.reduce.tasks=4 \

3.2 Part 2

Please use mulitple mappers and reducers for these jobs (at least 2 mappers and 2 reducers).
Perform a word count analysis of the Issue column of the Consumer Complaints Dataset using a Mapper and Reducer based WordCount (i.e., no combiners used anywhere) using user defined Counters to count up how many time the mapper and reducer are called. What is the value of your user defined Mapper Counter, and Reducer Counter after completing your word count job.

Mapper 3.2 Part 2

In [7]:

3.2 Part 2 Response

The value of the user defined Mapper Counter is: 2

The value of the user defined Reducer Counter is: 2

```
MRCounter
 Mapper=2
 Reducer=2
```

3.2 Part 3

Perform a word count analysis of the Issue column of the Consumer Complaints Dataset using a Mapper, Reducer, and standalone combiner (i.e., not an in-memory combiner) based WordCount using user defined Counters to count up how many time the mapper, combiner, reducer are called. What is the value of your user defined Mapper Counter, and Reducer Counter after completing your word count job.

Combiner 3.2_3.py

3.2 Part 4 Response

We used 2 Mapreduce jobs:

```
Job 1. First one to get frequencies of all the terms and the count of d
ocuments
Job 2. To sort the terms,terms frequencies by value,key columns
       filter , print 50 most frequent terms and 10 least frequent term
s
```

3.2.1 OPTIONAL

Using 2 reducers: What are the top 50 most frequent terms in your word count analysis? Present the top 50 terms and their frequency and their relative frequency. Present the top 50 terms and their frequency and their relative frequency. If there are ties please sort the tokens in alphanumeric/string order. Present bottom 10 tokens (least frequent items).

MapReduce Job 1 to calculate frequency for all items and Total Count

HW3.3. Shopping Cart Analysis

Product Recommendations: The action or practice of selling additional products or services to existing customers is called cross-selling. Giving product recommendation is one of the examples of cross-selling that are frequently used by online retailers. One simple method to give product recommendations is to recommend products that are frequently browsed together by the customers.

For this homework use the online browsing behavior dataset located at:

    https://www.dropbox.com/s/zlfyiwa70poqg74/ProductPurchaseData.txt?dl=0

Each line in this dataset represents a browsing session of a customer.
On each line, each string of 8 characters represents the id of an item browsed during that session. The items are separated by spaces.

Here are the first few lines of the ProductPurchaseData
FRO11987 ELE17451 ELE89019 SNA90258 GRO99222
GRO99222 GRO12298 FRO12685 ELE91550 SNA11465 ELE26917 ELE52966 FRO90334 SNA30755 ELE17451 FRO84225 SNA80192
ELE17451 GRO73461 DAI22896 SNA99873 FRO86643
ELE17451 ELE37798 FRO86643 GRO56989 ELE23393 SNA11465
ELE17451 SNA69641 FRO86643 FRO78087 SNA11465 GRO39357 ELE28573 ELE11375 DAI54444

Do some exploratory data analysis of this dataset.

How many unique items are available from this supplier?

Using a single reducer: Report your findings such as number of unique products; largest basket; report the top 50 most frequently purchased items, their frequency, and their relative frequency (break ties by sorting the products alphabetical order) etc. using Hadoop Map-Reduce.

3.3 EDA Using Python

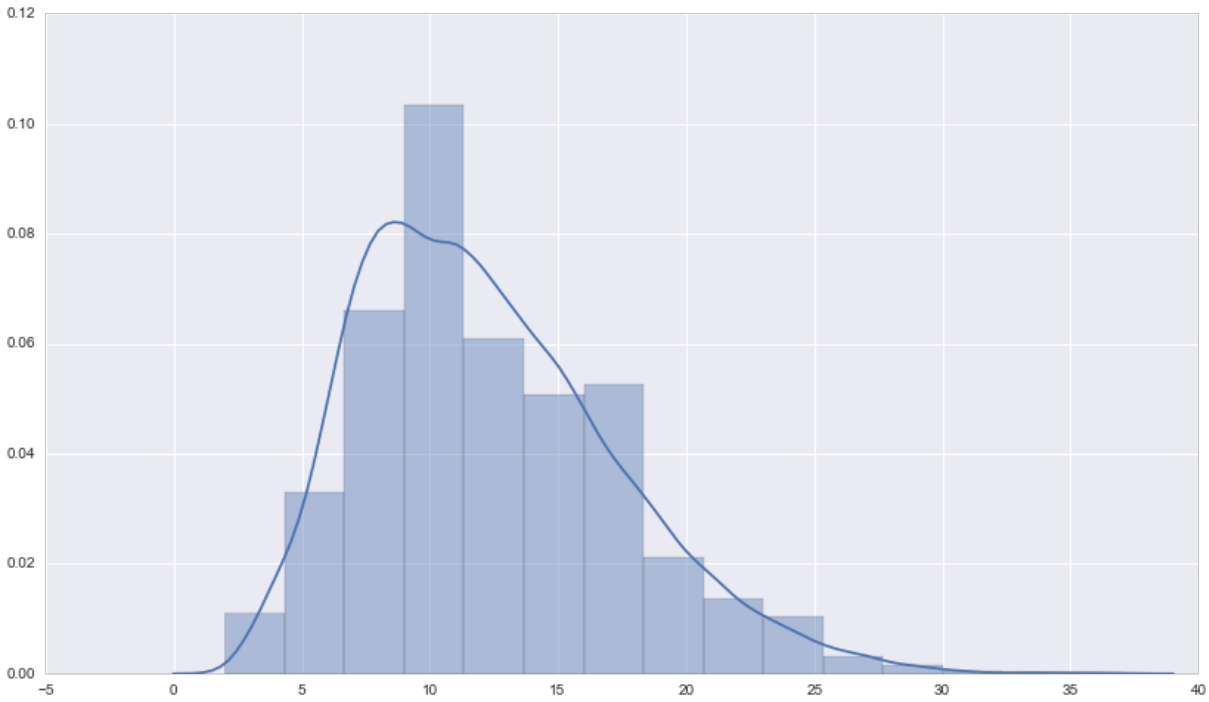
In [39]:
```
# Use Python to do EDA
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
from collections import Counter
%matplotlib inline
```

We'll use Python to perform some exploratory data analysis before we use the MapReduce framework.

In [181]:
```
def hw_3_3_eda():
    # Items dictionary
    items = Counter()
    # Basket size variable
    basket = []
    # Iterate over records
    with open("ProductPurchaseData.txt", "r") as f:
        for line in f:
            # Split into individual items
            record = line.strip().split()
            # Add items to dictionary and to basket
            items += Counter(record)
            basket.append(len(record))
    # Print result and plot basket size distribution
    print ("The number of total items: {}.".format(sum(items.values
())))
    print ("The number of unique items: {}.".format(len(items)))
    print ("The average size of the basket: {:.2f}.".format(np.mean
(basket)))
    plt.figure(figsize=(14,8))
    sns.distplot(basket, bins=15)

hw_3_3_eda()
```

```
The number of total items: 380824.
The number of unique items: 12592.
The average size of the basket: 12.24.
```



3.3 MapReduce

Strategy:

- 1st stage:
  Mapper: purchase_record -> (item, 1, basketsize) (including (*,count) for order inversion in relative frequency calculation)
  Reducer: (item, count) -> (item, total count, relative frequency, largest basketsize)
- 2nd stage:
  Sort 1st stage output by total count.

3.3.1 OPTIONAL

Using 2 reducers: Report your findings such as number of unique products; largest basket; report the top 50 most frequently purchased items, their frequency, and their relative frequency (break ties by sorting the products alphabetical order) etc. using Hadoop Map-Reduce.

3.3.1 Strategy

The key is to direct total counts from the first mapper to the 2 reducers using two * keys ('*0' and '*1') for order inversion. The rest is same as above.

3.31 Mapper

In [1]:
```
%%writefile mapper_3_3_1.py
#!/usr/bin/env python
# Mapper for 3.3.1
# Author: Konniam Chan
# Shopping cart analysis
# Output goes to 1 reducer
import sys

# Count how many mappers called
sys.stderr.write("reporter:counter:MR-Counter,Num_mapper_calls,1\n"
)

for line in sys.stdin:
    record = line.strip().split()
    basketsize = len(record)
    # Assume 2 reducers in the next step
    # Emit count and basketsize, (*) stands for the total
    for item in record:
        print '%s\t%s\t%s' % ('*0', 1, basketsize)
        print '%s\t%s\t%s' % ('*1', 1, basketsize)
        print '%s\t%s\t%s' % (item, 1, basketsize)
```

```
Writing mapper_3_3_1.py
```

3.3.1 Combiner

Can use the combiner from 3.3

3.3.1 Reducer

In [2]:
```
%%writefile reducer_3_3_1.py
#!/usr/bin/env python
# Reducer for 3.3.1
# Author: Konniam Chan
# Shopping cart analysis
# Assume 2 reducers
from __future__ import division
import sys
current_item = None
current_count = 0
current_basketsize = 0
item = None

# Count how many reducers called
sys.stderr.write("reporter:counter:MR-Counter,Num_reducer_calls,1\n
")

for line in sys.stdin:
    # Obtain item and intermediate counts
    line = line.strip()
    item, count, basketsize = line.split('\t')
    count = int(count)
    basketsize = int(basketsize)
    # Rely on sorting to increment item counts
    if current_item == item:
        current_count += count
        current_basketsize = max(current_basketsize, basketsize)
    else:
        # Obtain total count and save to memory
        if current_item in ['*0', '*1']:
            total = current_count
        # Compute counts and relative frequencies for regular items
        elif current_item:
            # Output (item, count, relative frequency)
            print '%s\t%s\t%s\t%s' % (current_item, current_count,
current_count / total, current_basketsize)
        current_count = count
        current_item = item
        current_basketsize = basketsize

# Output last item
if current_item == item:
    print '%s\t%s\t%s\t%s' % (current_item, current_count, current_
count / total, current_basketsize)
```

```
Writing reducer_3_3_1.py
```

In [3]:
```
!chmod a+x *_3_3_1.py
```

3.3.1 1st Stage MR

In [4]:
```
# Shopping cart analysis, with counters for number of mappers, combiners, and reducers
!hdfs dfs -rm -r /user/konniam/week_03/hw_3_3_1
# Use 2 mappers and 2 reducers

HW3.4. (Computationally prohibitive but then again Hadoop can handle this) Pairs

Suppose we want to recommend new products to the customer based on the products they have already browsed on the online website. Write a map-reduce program to find products which are frequently browsed together. Fix the support count (cooccurence count) to s = 100 (i.e. product pairs need to occur together at least 100 times to be considered frequent) and find pairs of items (sometimes referred to itemsets of size 2 in association rule mining) that have a support count of 100 or more.

List the top 50 product pairs with corresponding support count (aka frequency), and relative frequency or support (number of records where they coccur, the number of records where they coccur/the number of baskets in the dataset) in decreasing order of support for frequent (100>count) itemsets of size 2.

Use the Pairs pattern (lecture 3) to extract these frequent itemsets of size 2. Free free to use combiners if they bring value. Instrument your code with counters for count the number of times your mapper, combiner and reducers are called.

Please output records of the following form for the top 50 pairs (itemsets of size 2):

```
item1, item2, support count, support
```

Fix the ordering of the pairs lexicographically (left to right), and break ties in support (between pairs, if any exist) by taking the first ones in lexicographically increasing order.

Report the compute time for the Pairs job. Describe the computational setup used (E.g., single computer; dual core; linux, number of mappers, number of reducers) Instrument your mapper, combiner, and reducer to count how many times each is called using Counters and report these counts.

Strategy

- 1st stage:
  Mapper: basket -> (Item1, Item2, 1)
  Reducer: (Item1, Item2, 1) -> (Item1, Item2, count, relative frequency)
  (Use 2 mappers and 2 reducers)
- 2nd stage: Sort (Item1, Item2, count, relative frequency) by count

Mapper 3.4

In [60]:
```
%%writefile mapper_3_4.py
#!/usr/bin/env python
# Mapper for 3.4
# Author: Konniam Chan
# Pairs analysis
import sys
from itertools import combinations

for line in sys.stdin:
    # Count how many mappers called
    sys.stderr.write("reporter:counter:MR-Counter,Num_mapper_calls,
1\n")
    record = line.strip().split()
    # Assume all items in basket co-occur, get all combinations of
items
    # Sort by alphanumerical order first and eliminate potential du
plicates
    record = sorted(set(record))
    for combo in combinations(record, 2):
        # Emit each co-occurrence pair
        print '%s.%s\t%s' % (combo[0], combo[1], 1)
    # Assume 1 reducer in the next step
    # Emit total with key (*0 and *1) for order inversion (keep tra
ck of total number of baskets)
    # Assume output goes to 2 reducers
    print '%s\t%s' % ('*0' , 1)
    print '%s\t%s' % ('*1' , 1)
```

```
Overwriting mapper_3_4.py
```

Combiner 3.4

In [61]:
```
%%writefile combiner_3_4.py
#!/usr/bin/env python
## Combiner for 3.4
# Author: Konniam Chan
# Pairs analysis
import sys
current_pair = None
current_count = 0

for line in sys.stdin:
    # Count how many combiners called
    sys.stderr.write("reporter:counter:MR-Counter,Num_combiner_call
s,1\n")
    # Obtain pair and intermediate counts
    line = line.strip()
    pair, count = line.split('\t')
    count = int(count)
    # Rely on sorting to increment pair counts
    if current_pair == pair:
        current_count += count
    else:
        if current_pair:
            print '%s\t%s' % (current_pair, current_count)
        current_count = count
        current_pair = pair

# Output last pair
if current_pair == pair:
    print '%s\t%s' % (current_pair, current_count)
```

```
Overwriting combiner_3_4.py
```

Reducer 3.4

In [62]:
```
%%writefile reducer_3_4.py
#!/usr/bin/env python
## Reducer for 3.4
# Author: Konniam Chan
# Pairs analysis
from __future__ import division
import sys
current_pair = None
current_count = 0
s = 100

for line in sys.stdin:
    # Count how many reducers called
    sys.stderr.write("reporter:counter:MR-Counter,Num_reducer_calls
,1\n")
    # Obtain pair and intermediate counts
    line = line.strip()
    pair, count = line.split('\t')
    count = int(count)
    # Rely on sorting to increment pair counts
    if current_pair == pair:
        current_count += count
    else:
        # Obtain total count and save to memory
        if current_pair in ['*0', '*1']:
            total = current_count
        elif current_pair:
            # Emit only if count is above s (100)
            if current_count >= s:
                item_1, item_2 = current_pair.split('.')
                print '%s\t%s\t%s\t%s' % (item_1, item_2, current_c
ount, current_count / total)
        current_count = count
        current_pair = pair

# Output last pair
if current_pair == pair:
    # Emit only if count is above s (100)
    if current_count >= s:
        item_1, item_2 = current_pair.split('.')
        print '%s\t%s\t%s\t%s' % (item_1, item_2, current_count, cu
rrent_count / total)
```

```
Overwriting reducer_3_4.py
```

In [63]:
```

3.4 Pairs Statistics

Property	**Configuration**
Operating System	Mac
Cores	2
Memory	4GB
Number of Tuples Processed	
- Mappers	31,101
- Combiners	2,596,216
- Reducers	1,026,711

Stage	Elapsed Time (s)
1st Stage MapReduce (2 mappers, 2 reducers, with combiners)	56
2nd Stage MapReduce (2 mappers, 1 reducer)	19
Total	75

HW3.5: Stripes

Repeat 3.4 using the stripes design pattern for finding cooccuring pairs.

Report the compute times for stripes job versus the Pairs job. Describe the computational setup used (E.g., single computer; dual core; linux, number of mappers, number of reducers)

Instrument your mapper, combiner, and reducer to count how many times each is called using Counters and report these counts. Discuss the differences in these counts between the Pairs and Stripes jobs

Strategy

- 1st stage:
  Mapper: basket -> (Item_i, Stripe_i) [where Stripe_i is a json formatted string]
  Reducer: (Item_i, Stripe_i) -> (Item1, Item2, count, relative frequency)
  (Use 2 mappers and 2 reducers)
- 2nd stage: Sort (Item1, Item2, count, relative frequency) by count

3.5 Mapper

In [8]:
```
%%writefile mapper_3_5.py
#!/usr/bin/env python
# Mapper for 3.5
# Author: Konniam Chan
# Stripes shopping cart analysis
import sys
import json
from itertools import combinations

for line in sys.stdin:
    # Count how many mappers called
    sys.stderr.write("reporter:counter:MR-Counter,Num_mapper_calls,
1\n")
    # Read record
    record = line.strip().split()
    # Assume all items in basket co-occur, get all combinations of
items
    # Sort by alphanumerical order first and eliminate potential du
plicates
    record = sorted(set(record))
    # Skip last item because it will always be part of another item
's row
    stripes = {item:{} for item in record[:-1]}
    # Create stripes
    for pair in combinations(record, 2):
        stripes[pair[0]][pair[1]] = 1
    # Emit each stripe
    for k,v in stripes.items():
        print '%s\t%s' % (k, json.dumps(v))
    # Emit basket count for order inversion
    # Assume 2 reducers
    print '%s\t%s' % ('*0', json.dumps({"*0": 1}))
    print '%s\t%s' % ('*1', json.dumps({"*1": 1}))
```

3.5 Response

In the pairs formulation, there are many records transmitted between the mappers and the reducers. In this particular problem, the reducer received over 1,000,000 records. In the stripes formulation, due to the more condensed structure of the stripe, there are only about 17,000 records. In jobs where there are a large number of mappers and reducers on different networks, the number of tuples sent in the pairs approach could be prohibitive. In our pseudo-distributed environment, both mappers and reducers live on the same network and we didn't incur any network costs. The stripes approach is faster by 12 seconds. If the network costs were more significant, we would see stripes performing significantly better.

HW3.6

What is the Apriori algorithm? Describe an example use in your domain of expertise and what kind of . Define confidence and lift.

Apriori

The Apriori algorithm is used to find frequent item sets. These sets are useful in generating assocation rules, which are widely used in recommendations. The central idea is that if a set of items A is frequent, so is any subset of A. Thus, if any subset of A is not frequent, then A cannot be frequent. This idea is used to limit the large space of higher-number item sets.

The algorithm works in stages. In the first pass, we look at all baskets of transactions and generates a list of counts for each item (C1). We filter it based on a specified minimmum support count and obtain a set of frequent items of size 1 (L1). In the second pass, we look at all baskets, filtered out all items NOT in L1, then use the rest to generate candidate paris (C2). We filter this list to generate frequent items of size 2 (L2). In the third pass, we look at all baskets and filtered out all items not in L1. We form pairs, then filter out items not in L2. We then form triplet candidates (C3), filter to get L3. Repeat until we get to the size of frequent items that we want.

Confidence and Lift

For an association rule A -> b, **confidence** measures how "likely" b would occur, in the baskets that contain A. High confidence means that if A is in the basket, b is likley to be in the same basket. The formula is: $\frac{support(A\ U\ b)}{support(A)}$.

Lift measures the ratio between confidence and how likley is b to occur unconditionally. It can be calculated as $\frac{Confidence(A->b)}{Confidence(null->b)}$ where $Confidence(null->b) = support(b)$

Applications

One could use Apriori algorithm to create marketing campaigns in retail stores, let's say at Starbucks. If an association rule shows that two food items are often purchased together, we can advertise both items in some fashion to increase revenue per transaction.

HW3.7. Shopping Cart Analysis

Product Recommendations: The action or practice of selling additional products or services to existing customers is called cross-selling. Giving product recommendation is one of the examples of cross-selling that are frequently used by online retailers. One simple method to give product recommendations is to recommend products that are frequently browsed together by the customers.

Suppose we want to recommend new products to the customer based on the products they have already browsed on the online website. Write a program using the A-priori algorithm to find products which are frequently browsed together. Fix the support to s = 100 (i.e. product sets need to occur together at least 100 times to be considered frequent) and find itemsets of size 2 and 3.

Then extract association rules from these frequent items.

A rule is of the form:

(item1, item5) ⇒ item2.

List the top 10 discovered rules in descreasing order of confidence in the following format

(item1, item5) ⇒ item2, supportCount ,support, confidence

Strategy

We will do 3 passes over the data, to get the set of triples with support of at least 100 (L3). Then we can easily do another MR job to calculate confidence by dividing L3 counts with the corresponding L2 counts. Thus, in total we will run 4 MR jobs.

HW3.8

Benchmark your results using the pyFIM implementation of the Apriori algorithm (Apriori - Association Rule Induction / Frequent Item Set Mining implemented by Christian Borgelt). You can download pyFIM from here:

http://www.borgelt.net/pyfim.html (http://www.borgelt.net/pyfim.html)

Comment on the results from both implementations (your Hadoop MapReduce of apriori versus pyFIM) in terms of results and execution times.

In [51]:
```
from fim import apriori
```

In [57]:
```
def apriori_3_8():
    # Pre-process to create iterable
    transactions = []
    with open('ProductPurchaseData.txt', 'r') as f:
        for line in f:
            items = line.strip().split()
            transactions.append(items)
    # Apriori
    results = apriori(transactions, target='r', supp=-100, zmin=3,
zmax=3, report='asc')
    # Sort by confidence, then by support
    results = sorted(results, key=lambda x: (-x[4], -x[3]))
    for row in results[:10]:
        print row[1], row[0], row[2], row[3], row[4]

apriori_3_8()

```

The results of Mapreduce and pyFIM implementatioans are identical. In terms of execution times, pyFIM took less than 1 second, while MR took about 3 mins in total. Because the data set is small in this case and could be held in memory effectively, the in-memory approach of pyFIM is much faster. However, if the data set wee 1TB, Mapreduce could still handle it with multiple machines, where as pyFIM will fail to work.
